Product Description

The term "fish game" typically refers to arcade-style video games that simulate fishing or underwater hunting. These games often feature a large screen display, multiple player stations with individual controls, and a variety of visual and audio effects.

The wiring harness of a fish game refers to the specific wiring system used in these arcade machines. It serves a similar purpose as the wiring harness in a slot machine, providing electrical connections between various components.

The fish game wiring harness may include wires for functions such as:

Power supply: Distributing power to the main control board, display screen, sound system, and other components.

Control inputs: Transmitting signals from the buttons, joysticks, or other input devices on the player stations to the main control board.

Display connections: Connecting the main control board to the display screen or screens, ensuring proper video and graphics transmission.

Audio connections: Transmitting audio signals from the main control board to the speakers or sound system.

Network and communication lines: If the fish game supports multiplayer or online features, the wiring harness may include connections for networking and communication between different machines.

Lighting and effects: Wiring for various lighting elements, such as LED strips, backlights, or other visual effects, to enhance the gaming experience.
